

CHEMISTRY 202  
Hour Exam I  
September 21, 2023  
Dr. D. DeCoste

Name                     **KEY**                    

Signature \_\_\_\_\_

T.A. \_\_\_\_\_

This exam contains 23 questions on 9 numbered pages. Check now to make sure you have a complete exam. You have two hours to complete the exam. Determine the **best** answer to the first 20 questions and enter these on the special answer sheet. Also, **circle your responses** in this exam booklet.

**Show all of your work and provide complete answers to questions 21, 22 and 23.**

1-20	(60 pts.)	_____
21	(20 pts.)	_____
22	(20 pts)	_____
23	(20 pts.)	_____
Total	(120 pts)	_____

Useful Information:

Always assume ideal behavior for gases (unless explicitly told otherwise).

$$PV = nRT$$

$$R = 0.08206 \text{ Latm/molK} = 8.3145 \text{ J/Kmol}$$

$$K = ^\circ\text{C} + 273$$

$$N_A = 6.022 \times 10^{23}$$

$$u_{\text{rms}} = \sqrt{\frac{3RT}{M}}$$

$$\lambda = \frac{1}{\sqrt{2}(N/V)(\pi d^2)}$$

$$Z_A = A \frac{N}{V} \sqrt{\frac{RT}{2\pi M}}$$

$$Z = 4 \frac{N}{V} d^2 \sqrt{\frac{\pi RT}{M}}$$

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Solubility Rules:

1. Most nitrate salts are soluble.
2. Most salts of sodium, potassium, and ammonium cations are soluble.
3. Most chloride salts are soluble. Exceptions: silver, lead(II), and mercury(I) chloride.
4. Most sulfate salts are soluble. Exceptions: calcium, barium, and lead(II) sulfate.
5. Most hydroxide salts can be considered insoluble. Soluble ones: sodium, potassium, and calcium hydroxide.
6. Consider sulfide, carbonate, and phosphate salts to be insoluble.

- Which of the following contains the **greatest** percent by mass oxygen?  

<input checked="" type="checkbox"/> a) Sodium bicarbonate				
<input type="checkbox"/> b) Potassium phosphate				
<input type="checkbox"/> c) Barium hydroxide				
<input type="checkbox"/> d) Potassium nitrate				
<input type="checkbox"/> e) Sodium sulfate				
- Which of the following is the closest estimation of the number of atoms that make up an adult human? 1 kg is about 2.2 lbs. on Earth.  

a) $10^{18}$	b) $10^{23}$	<input checked="" type="checkbox"/> c) $10^{27}$	d) $10^{32}$	e) $10^{37}$
--------------	--------------	--	--------------	--------------
- Iron (Fe) reacts with oxygen gas to form iron(II) oxide and iron(III) oxide. You react 1.00 mole of iron with 20.0 g of oxygen gas to form a mixture of the oxides, with no leftover reactants. Determine the mass of iron(III) oxide produced.  

a) 35.9 g	<input checked="" type="checkbox"/> b) 39.9 g	c) 71.9 g	d) 75.9 g	e) 79.9 g
-----------	---	-----------	-----------	-----------
- You react **equal masses** of reactants together. For which of the following cases is oxygen gas **not** the limiting reactant?  

<input checked="" type="checkbox"/> a) Reacting calcium metal with oxygen gas to produce calcium oxide.				
<input type="checkbox"/> b) Reacting methane ( $\text{CH}_4$ ) with oxygen gas to produce carbon dioxide and water.				
<input type="checkbox"/> c) Reacting hydrogen and oxygen gases to produce water.				
<input type="checkbox"/> d) Oxygen gas limits all of the reactions described above (a-c).				
<input type="checkbox"/> e) Oxygen gas does not limit any of the three reactions described above (a-c).				
- You have a 100.0 g mixture of methane ( $\text{CH}_4$ ) and oxygen gas, which react to produce carbon dioxide and water. What is the **maximum mass** of carbon dioxide that can be produced?  

a) 46.21 g	<input checked="" type="checkbox"/> b) 54.98 g	c) 68.75 g	d) 100.0 g	e) More data required.
------------	--	------------	------------	------------------------
- Consider aqueous solutions of barium nitrate and potassium hydroxide, each with the **same concentration** as measured in units of molarity. You mix 100.0 mL of the barium nitrate solution with the potassium hydroxide solution such that the concentration of the nitrate ions is **four times** that of the concentration of the barium ions in solution **after the reaction** is complete. What volume of potassium hydroxide solution was added?  

a) 16.7 mL	b) 33.3 mL	c) 50.0 mL	d) 66.7 mL	<input checked="" type="checkbox"/> e) 100.0 mL
------------	------------	------------	------------	---
- Consider 0.100M aqueous solutions of sodium chloride and silver nitrate. What volume of the 0.100M sodium chloride solution must be added to 100.0 mL of the 0.100M silver nitrate solution such that the concentration of the silver ions in the final solution is 0.0200M?  

a) 16.7 mL	b) 33.3 mL	c) 50.0 mL	<input checked="" type="checkbox"/> d) 66.7 mL	e) 100.0 mL
------------	------------	------------	--	-------------

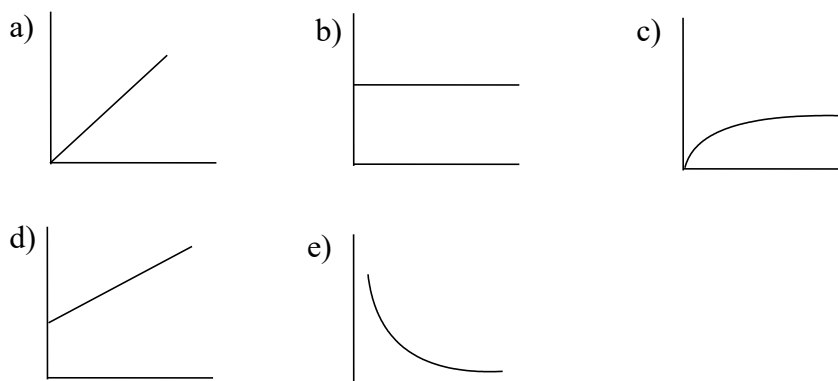

8. When 100.0 mL of a 0.100M solution of magnesium nitrate is mixed with 100.0 mL of a 0.100M solution of sodium nitrate, what is the concentration of the nitrate ions?
- a) 0.0500M      b) 0.100M      c) 0.150M      d) 0.200M      e) 0.300M
9. When solid potassium chlorate ( $\text{KClO}_3$ ) is heated, the products are potassium chloride and oxygen gas. A 15.0 g sample of potassium chlorate is heated for a bit of time and the oxygen gas is collected in a balloon. The volume of the balloon is measured to be 3.14 L at 1.00 atm and 25°C. Which of the following best describes the situation?
- a) There is  $\text{KClO}_3$  remaining after heating and 9.57 g of potassium chloride is produced.  
b) There is  $\text{KClO}_3$  remaining after heating and 9.12 g of potassium chloride is produced.  
c) There is  $\text{KClO}_3$  remaining after heating and 6.38 g of potassium chloride is produced.  
d) All of the potassium chlorate was converted to potassium chloride and oxygen.  
e) The data are incorrect. There was not enough oxygen produced to make a balloon that size at those conditions.
10. Consider a mixture of **equal masses** of helium (He) gas and neon (Ne) gas in a rigid vessel. Determine the ratio of:

$$\frac{[\text{collision frequency } (Z_A) \text{ of He}]}{[\text{collision frequency } (Z_A) \text{ of Ne}]}$$

(for a given area, A, of the walls of each container)

- a) 0.4454      b) 1.000      c) 2.245      d) 5.042      e) 11.32

- 
- 11-13. Indicate which of the graphs below best represents each plot described in questions 11, 12, and 13. Note: the graphs may be used once, more than once, or not at all.

11. Change in momentum per impact (y) vs. T (x) for an ideal gas at constant V. c
12. Collision frequency ( $Z_A$ ) (y) vs. P (x) for an ideal gas at constant V and T. a
13. Volume (y) vs. T (°C) (x) for a sample of an ideal gas in a container fitted with a massless, frictionless piston. d

19. In an evacuated, rigid steel container at constant temperature you react an equal number of moles of  $\text{PCl}_3(g)$  and  $\text{Cl}_2(g)$  so that the total pressure is 16.0 atm. The system reaches equilibrium according to the following chemical equation:

After equilibrium is reached, you note that the partial pressures of all three gases are equal. Determine the value of the equilibrium constant,  $K_p$ , for the reaction as written above.

- a) 0.0313      b) 0.0625      c) 0.125      **d) 0.250**      e) 1.00
20. The gases  $\text{NH}_3$  (partial pressure = 5.0 atm) and  $\text{O}_2$  (partial pressure = 5.0 atm) are placed in a steel rigid container. They react to equilibrium at constant temperature according to the following equation, for which  $K_p = 1.0 \times 10^{18}$ .

Determine the equilibrium pressure of  $\text{O}_2(g)$ .

- a)  $2.4 \times 10^{-17}$  atm    b)  $1.2 \times 10^{-11}$  atm    c)  $1.3 \times 10^{-3}$  atm    **d)  $6.5 \times 10^{-3}$  atm**    e)  $3.3 \times 10^{-2}$  atm

21. For both portions of question 21, **show and explain** all work. Full credit is reserved for a **systematic approach to solving each problem**.
- a. You have a binary ionic oxide that is 53.0% metal by mass. The compound has a molar mass that is less than 125 g/mol. With just this information and knowledge and understanding of fundamental chemical principles, provide the **formula and name** for this compound. If you believe there is more than one possible answer, please provide **all possible** formulas and names, and support your answers. **[10 points]**
- 

Either **MnO<sub>3</sub> (manganese(VI) oxide)**, or **Al<sub>2</sub>O<sub>3</sub> (aluminum oxide)**.

21. b. You pour 100.0 mL of a lead(II) nitrate solution into 100.0 mL of a silver nitrate solution such that the **percent by moles of lead(II) ions** is 11.1% of all ions in solution. You label this Solution A.

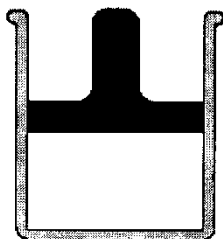

You add an excess of a potassium chloride solution to Solution A. You collect and dry all of the solid and find the sample to have a mass of 88.9g.

Determine the **concentration of the nitrate ions** in Solution A (that is, before the potassium chloride was added) in terms of **molarity**. [10 points]

---

The original concentration of the nitrate ion = **3.14M**

22. Consider a cylindrical container fitted with a massless, frictionless piston as shown below:

To this container, which is sitting in an environment at 1.000 atm and 587K, you add a mixture of methane ( $\text{CH}_4$ ), propane ( $\text{C}_3\text{H}_8$ ), and oxygen gases such that the original volume of the container is 120.4 L. Reactions are initiated (methane and propane each react with oxygen to produce carbon dioxide gas and water vapor), and when the reactions are run to completion, the product mixture (which includes oxygen gas) returns to 587K.

According to your measurements, the final density of the mixture is 89.28% of the initial density of the mixture. Determine the following:

- The **mole fraction of propane gas** in the original reactant mixture.
- The **range of possible mole fractions of methane gas** in the original reactant mixture.

Full credit is reserved for **showing all work** and **providing complete explanations** with a **correct and coherent general solution**. That is, your answer should not only include **equations and calculations**, but **explanations about what you are doing and why**. Make sure to **define any variables** and to **state and justify any assumptions**. Please use the next page if needed. [20 points]

---

**Mole fraction propane =  $0.3000/2.500 = 0.1200$**

**Methane must have mole fraction LESS THAN  $0.2333/2.500 = 0.0933$**

22. Continue work on this problem below, if needed.

23. The molecule borane ( $\text{BH}_3$ ) is relatively unstable and will react with itself to form diborane ( $\text{B}_2\text{H}_6$ ), a process known as dimerization. In a closed container, of course, the system will reach equilibrium, and it does so according to the following equation:

Consider a container fitted with a massless, frictionless piston in a lab room at 1.00 atm and 25°C. To this container you add borane gas until the volume of the container is 24.45 L. The system as written above reaches equilibrium at 25°C. At this point the density of the gaseous mixture is 1.069 g/L.

**Determine the value of the equilibrium constant,  $K_p$ , for this reaction at 25°C.  
Show and explain all work. [12 points]**

---

$$K_p = 72.6$$

23. b. Suppose you have the system at equilibrium as seen in part a. You quickly add the inert gas argon (Ar) at 25°C such that the gaseous mixture is 50% argon by moles (the borane and diborane do not have time to react at this point) and, after all of the argon has been added, the piston is locked into place. **Is the system still at equilibrium?** If you believe so, explain why adding argon gas does not affect the equilibrium position. If the believe that equilibrium was disturbed, when the system re-achieves equilibrium, **will the mole percent of argon gas be less than, greater than, or equal to 50%?**

Please provide support (conceptual and or quantitative) for your answers, along with a discussion of Q vs. K. **[8 points]**

---

Thus, mole percent of argon gas is **less than 50%**
